Introduction

Until recently, management of food safety in food and drink manufacturing/processing (FDMP) businesses has focused on physical, chemical, biological and allergenic risks (FSA, 2017). Assessment of food safety culture (FSC) is now a fundamental requirement in the food industry and encompasses consideration and analysis of the foundations that food safety (FS) practices are based (GFSI, 2020).

FSC is defined as "the prevailing attitudes, values and practices related to food safety that are taught, directly and indirectly, to new *employees*" (Taylor, 2011). Its importance has resulted in the measurement and improvement of a company's FSC is now included in all GFSI certified FS standards and EC Regulation 852/2004 (on the hygiene of foodstuffs), meaning that for many businesses there is now a requirement to complete this. In BRCGS for FS specifically, there is the explicit requirement that "*the site's senior management* shall define and maintain a clear plan for the development and continuing improvement of a food safety and quality culture" (BRCGS, 2018).

FDMP businesses can choose to use a commercially available measurement tool or create their own measurement tool. Use of a commercially available FSC measurement tool often relies on quantitative data and can contribute to inaccurate results (Jespersen and Wallace, 2017) and also may be financially out of reach for small businesses. Conversely, as a relatively new concept, SME expertise of FSC measurement may also be limited, providing challenges to enable effective FSC measurement.

Aims

This study aimed to use in-depth, qualitative data to inform development of a bespoke food safety culture measurement tool for a low-risk food and drink manufacturer.

Methodology

Use of qualitative interviews were undertaken with company employees to obtain in-depth insight into factors that may influence FSC in the company.

- An interview schedule was developed based on a review of FS and FSC literature. The schedule was structured according to four FSC parameters (People, Process, Purpose and Proactivity) (Taylor and Rostron, 2018) and 20 dimensions, set out in the BRCGS recognised "Culture Excellence" assessment tool (BRCGS, 2021).
- The schedule had a broad scope to enable the understanding of staff attitudes and perceptions that may influence FSC in the company, as well as awareness of FSC and FS risks.
- Interviews were carried out with 21 company employees (11 from management and 10 operatives).
- Anonymous audio files of the interviews were transcribed; a content analysis was carried out using NVivo (Version 12).
- Ethical approval was obtained for implementation of this study (PGT-2878).

Development of a Bespoke Food Safety Culture Measurement Tool for a Low-Risk Food and Drink Manufacturer

Laura Hewitt^{*1} and Dr Elizabeth C. Redmond¹

Results and Discussion

Variable attitudes and perceptions toward FSC influencing factors were determined from the study. Discrepancies were determined between participant groups with differing attitudes toward 'co-ordination' and 'vision', whilst operatives and management attitudes toward 'empowerment' and 'investment' concurred. Data suggested a difference in food safety perceptions between management and operatives.

FDMP business employees indicated a lack of awareness of the term FSC and the importance of a positive FSC.

• Many operatives were unaware of FS measurement metrics in place in the business, whilst management predominantly discussed complaints data as the sole FS metric in place.

Management demonstrated a greater understanding of FSC themes associated with the 'proactivity' parameter.

Management and operative attitudes toward 'investment' were aligned – both indicated belief that sufficient investment was provided by the company.

Attitudinal differences were apparent between managers and operatives relating to the 'control', 'co-ordination' and 'vision' parameters. This requires further exploration when determining the FSC of the business and may be a focus of future intervention.

Control of contractors, asset care and FS communications (including training, metrics and targets) were areas where further investigation is required to better understand the FSC of the business.

nclusions

Qualitative interviews enabled an in-depth insight into attitudes and perceptions associated with FSC from management and operative employees in a FDMP business.

Data has informed development of a bespoke quantitative FSC questionnaire which included attitude assessment related to parameters and dimensions determined in this qualitative study.
